Selling Steel Beams and Batteries (Q0)!

Steel Beams: \$0.50 below MP || Batteries (Q0): \$2 below MP

Fast deals, competitive pricing, message [Appalachian State University](#) if you're interested or need bulk!

From The Brink of Resto Death by Circuit Intel

About a year ago, I started playing this game after some friends at school introduced it to me, and at first I didn't think much of it. I just figured I'd mess around and see how far I could get. I started with around 6 million in company value before the whole ordeal I am about to describe happened, and I was doing fine. I had already bounced around a few industries like construction, electronics, and then aerospace, where I focused on cockpits. That's when the recession hit and everything started going downhill.

During that time, my company was losing about 30 to 50 grand a day because of my weirdly high sourcing costs and high AO, and I didn't really know how to stop it or stabilize anything. Instead of trying to recover in aerospace or going back to electronics, I made the decision to switch to restaurants. Looking back, that was probably the turning point where everything started getting worse. I still had the mindset that switching industries would fix the situation even though I only had about 1 million in cash left. I did understand that restaurants quickly drain money if you're not set up properly, but I still decided to change because I had felt bored.

I effectively jumped in already knowing it wouldn't turn things around, but still did it and just put myself in a worse position almost immediately, ignoring my friends' suggestions to stop and just wait until the recession was over. Once I got into restaurants, I tried following the standard 3-2-3 setup that AI said would work. I thought copying a "trusted" strategy would be enough, but I didn't really understand how to actually manage it, and I definitely didn't have much room for mistakes. I also tried to cut costs by producing my own food instead of buying it off the

exchange. In theory it sounded like a smart move, but in reality it didn't help and just made everything more complicated. I even ended up scrapping my leveled electronics factories trying to make it work, which ended up just wasting time because I could have just auctioned them.

After the restaurant business started, things really went off a cliff. Instead of improving, I started losing over 300,000 a day. It was way worse than anything before, and it basically made recovery impossible. Every time I checked, the losses were just stacking up, and there wasn't a point where I could realistically fix it anymore. It didn't even feel gradual; it was just a fast spiral where everything kept getting worse. In the end, the restaurant switch turned a struggling company into a full collapse, and the lesson learned was pretty simple: switching industries without a reason or a plan, especially when you're already losing money, just makes everything snowball in the worst way. In short, if you are a beginner looking to move into the restaurant industry, don't.

Contract Etiquette By Appalachian State University

In any player-driven economy, communication is the backbone of efficient trade. Yet recently, a recurring frustration has been surfacing in sales chat interactions that's worth addressing: the disconnect between initial interest and final commitment and the time cost it creates for sellers.

It often starts simply. A buyer messages asking for an item being sold. The seller responds in good faith, sometimes after a short delay, confirming availability and offering a reasonable price based on market conditions and effort spent holding inventory. So far, so good. But then comes the stall. Messages go unanswered. Minutes stretch into hours. Meanwhile, the seller is left holding inventory that was effectively "reserved" in conversation, unable to move it elsewhere.

In some cases, the buyer eventually responds only to decline, citing price or quality expectations that were never clearly stated in the initial request. The result is lost time, reduced liquidity, and preventable inefficiency in a system that already depends heavily on fast-moving transactions. At the heart of the frustration is not negotiation itself, which is expected and healthy.

The issue is implied commitment without explicit agreement. When a buyer initiates interest but does not clarify constraints such as target price, quality range, or urgency, sellers are left making assumptions. When those assumptions do not align with the buyer's expectations, the burden

quietly shifts back onto the seller. This creates a soft “holding pattern” where inventory is effectively paused without formal reservation or compensation. This is not about blaming buyers or sellers, but about tightening communication norms. A few simple improvements could reduce friction significantly:

- State expectations upfront such as price range, quality threshold, or timing
- Confirm intent before delay, for example “I’m interested, give me 10 minutes to decide”
- Avoid silent holds unless explicitly agreed
- Close loops clearly, even when declining

Efficient markets do not just depend on supply and demand, they depend on clarity. In a fast-paced trading environment like SimCo, respect is not only about politeness, it is about precision in communication. Every minute an item sits in limbo is a minute it is not working for anyone, and in a game built on optimization, that inefficiency adds up quickly.

A Rough Ride in Transport by National Reserves

The transport industry, as I have said before in previous issues, is pretty obscure/unappreciated. Not only this, but in recent weeks it has been a hell-hole for producers. Prices have been fluctuating, but, as reported last time, on a general trend of falling, and not in a stable way. The cost to produce, (COGS), has unwavered after dropping to .29~ish area, while market prices have continued to plummet, only slightly fluctuating upwards in the past couple of days. But, the fascinating thing I observe, my own company is *not* in fact struggling, despite a calculated profit margin of 1.73%. I interviewed Stranded Manikin, and here is what they had to say on the subject.

“How has business been going? Have you noticed any differences in sales?” - Me

“Selling has been cheap and yes I have noticed lol” -Stranded Manikin

“How about profit, what has happened to profits as the MP drifts closer to the COGS?” -Me

“At this point my cost is 32 cents. I'm not doing it for the profit. I sell a lot on the market and I always need transport. I just sell off the excess. It's almost cost at this point. ” -Stranded Manikin

“Thank you, that is all.” -Me
