The Endgame Requires a Blue Ocean adapted from Orbital Outpost's reddit article

A Late-game Sim Companies tends to look like an overcrowded air space with elite companies being doomed to end up in Aerospace or Electronics production bottlenecks. The most prominent companies require a huge capital absorber in order to make the economic situation more interesting; Maritime industry is exactly what the game requires in order to be balanced properly. The combination of the extremely high assets of Heavy Manufacturing and quick operation of Restaurants is absolutely unique and provides the player with another challenging sandbox.

Multi-stage production process allows for using an excellent macroeconomic brake, which is really needed for the existing Sim Company's ecosystem. The construction of a ship requires a huge runway and the locking of millions of liquidity of the company for several days during the production period in the Shipyard and Drydock.

The true brilliance of the system is in its multiple, divergent endgame sink options which ensure that no one style of gameplay will be enforced upon any player. One can hunt for the marginally profitable B2B business contracts which supply commercial superyachts, sink the highly militarized destroyers into exclusive government defense contracts, or focus entirely on servicing the public. Operation of the Cruise Terminal is similar to operating an upscale dining establishment worldwide with constant need for luxury goods and catering and energy supply.

In summary, this whole maritime expansion creates a bridge between the excess capacity of raw materials and the highest level of retail. It creates a world where construction planks, luxury

car seats, and consumer electronics all go into one big ocean. For the experienced playerbase, this future represents precisely what they have been waiting for - a means to spend billions without crashing the market.

The Long Road of Leveling Up By Appalachian State University

One of the biggest differences between being a new player and a veteran player is how quickly levels come and go. In the early stages of the game, leveling up can happen at an incredible pace. Some players have been known to reach level 10 in a single day simply by getting their operations up and running. At that point, each level feels like a major milestone, and the next one is always just around the corner.

As players progress, however, the experience changes dramatically.

The higher your level becomes, the more experience points (XP) are required to reach the next one. What once took hours can eventually take days, weeks, or even longer. For many players, leveling up becomes less about chasing the next level and more about consistently growing their company over time.

I know this feeling firsthand. I'm currently level 22 and have been there for quite some time. Despite actively managing my company and continuing to grow, progress toward the next level can sometimes feel slow. It's a reminder that advancement isn't meant to happen at the same pace forever.

One of the most important factors in earning XP is keeping buildings running. Production is the engine that drives experience gain, so idle buildings often mean missed opportunities. The more consistently your facilities are operating, the more XP your company can generate. This encourages players to maintain efficient supply chains and keep resources flowing through their production network.

Even then, there are times when it feels like it isn't enough. You can have every building running, maintain steady production, and still watch the XP bar move forward at what seems like a crawl. While that can be frustrating, it is also part of what makes higher levels meaningful. If level 22 took as little effort as level 2, reaching advanced levels would not feel like much of an achievement.

In many ways, leveling is a marathon rather than a sprint. The early game rewards rapid growth and experimentation, while the later game rewards consistency, planning, and patience. The players who continue optimizing their operations, expanding production, and keeping their facilities active are the ones who eventually reach those higher levels.

So if you've been staring at the same level for what feels like forever, don't get discouraged. Chances are you're making more progress than you think. Every production cycle, every resource processed, and every building kept running contributes toward that next level. It may not happen overnight, but each day brings you one step closer.

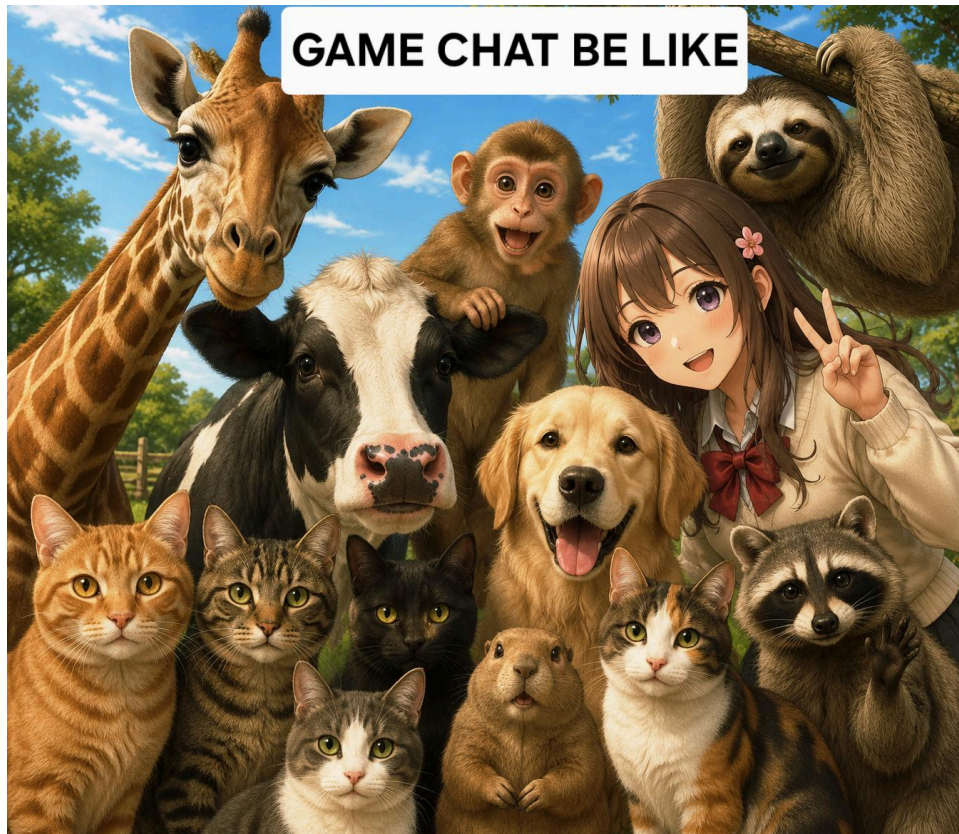

Hell on the Exchange by National Reserves

Once you've been hanging out for an hour in the SimCompanies exchange, you've probably already realized that it's not a sophisticated trading hall—this is chaos. One moment you earn a nice 10 percent margin on electronics, and suddenly a big corporation drops 100 thousand products in the middle of the exchange at a loss. And thus starts the infamous "race to the bottom" when emotions beat logic and prices drop below real costs of production within several hours.

Anatomy of the exchange wars is quite clear but cruel. It all starts with the inventory panic; some big companies understand that their warehouses are full, and they reduce prices a little bit in order to earn cash. It leads to a chain reaction when medium-size players reduce prices too, because they don't want to be left with unsold goods. And while all of this is going on, retailers calmly watch what's happening, pop corn, and do not buy anything until the prices finally fall down.

In order to survive in such a crazy world, it is necessary to act with cold calculation, rather than reacting with price increases. The best and most experienced tycoons do not even take part in the race; they just store their merchandise and wait for the weak people to exhaust themselves using their poor merchandise. Or, they use the pre-existing system of private contracts that ensures their liquidity from any market craziness.
