The Ultimate Guide to The Car Dealership by Horizon Automotive

In the intricate multiplayer economy of Sim Companies, few retail choices carry as much prestige—or risk—as opening a Car Dealership. While selling groceries or electronics offers steady, lower-margin volume, running a dealership puts CEOs face-to-face with the high-capital demands of the automotive industry. Done right, a dealership can turn massive profits and move millions in revenue; done wrong, it can drain a company's working capital in days.

Understanding the Mechanics

Unlike production facilities that transform raw materials into finished components, a Car Dealership operates strictly on the retail end of the supply chain. Retailers purchase vehicles—such as economy cars, luxury cars, electric vehicles, and trucks—and sell them to simulated consumers ("SimPeople") for green cash.

The fundamental math of retailing comes down to three factors:

Cost of Goods Sold (COGS): The purchase price of the vehicle.

Sales Speed: Driven by product Quality (Q) and market saturation.

Hourly Wage Overhead: The operational cost paid per hour the building runs.

Because vehicles are high-value items with long retail cycle times, managing hourly wage costs alongside administrative overhead is critical to keeping the business in the black.

The Sourcing Game: Market vs. Direct Contracts

A common mistake for novice dealers is relying on the public Market Exchange. Vehicles listed on the Exchange carry a 3% market tax for the seller, which gets baked into the listing price. As a result, buy prices on the open market are often too inflated for a dealership to turn a healthy profit margin.

To thrive, successful dealers rely on Direct Contracts negotiated with manufacturers via the Sales Chat or private messaging. By establishing long-term supplier partnerships, dealers bypass the 3% market fee and secure wholesale discounts. Producers gain a consistent buyer to keep their factories running, while dealers secure the low COGS needed to yield high hourly profits.

Quality, Demand, and Dynamic Pricing

The automotive market in Sim Companies shifts dynamically based on overall supply, economic cycles (Boom, Normal, Recession), and quality ratings. Higher quality (Q1, Q2, and beyond) speeds up sales drastically. Selling high-quality luxury cars during an economic Boom can net massive returns per hour, whereas holding low-quality stock during a Recession can paralyze capital flow.

Successful dealers frequently utilize external community tools, like retail calculators, to find the price point that maximizes their profit-per-hour rather than just profit-per-unit. Pushing sales prices too high slows down retail speed, dragging out wage costs and lowering net hourly gain.

Key Takeaways

Do the math first: Calculate wages and admin overhead against projected retail times before stocking high-tier vehicles.

Ditch the Exchange: Build reliable supplier networks through direct contracts to keep input costs low.

Watch economic shifts: Adapt your strategy based on economic phases to ensure inventory keeps moving.

Running a dealership in Sim Companies isn't for the faint of heart. It requires sharp analytical skills, active networking, and patience. But for players who master the supply chain, the dealership offers one of the most rewarding retail experiences in the game.

Has the Phrase “dead chat” Become Spam? By Appalachian State University

If you've been around the game for a while, you've probably seen the phrase “dead chat” used in social chat. When I first started playing, it was a common expression that simply meant the conversation had gone quiet. If nobody had sent a message for a while, someone would type “dead chat” to acknowledge the silence, and often it would spark a new conversation. It wasn't meant to annoy anyone or flood the chat. It was just part of the community.

Over time, though, the way the phrase is treated seems to have changed. At least from what I've observed, “dead chat” is now often classified as spam by moderator SM Technologies Inc. When the phrase appears, the message is frequently deleted, and players are warned that repeatedly posting it could lead to punishment for spamming.

I understand why moderators take spam seriously. Messages that are repeatedly posted in a short period of time can clutter the chat and make conversations harder to follow. Rules against spam are important for keeping the community enjoyable for everyone.

Where I think there is room for discussion is whether context should matter. If someone posts “dead chat” over and over again, then calling it spam makes sense. But if a player says it once after the chat has genuinely been inactive for a considerable amount of time, it feels different. In that situation, it isn't being used to flood the chat. It's simply a comment on the lack of conversation.

Moderating a community is never easy, and there will always be different opinions on where the line should be drawn. My hope is simply that intent and frequency are considered alongside the message itself. A single “dead chat” after a long period of silence doesn't seem equivalent to repeatedly posting the same message every few seconds.

At the end of the day, “dead chat” has long been a part of the game’s culture for many players. Whether it should continue to be allowed or be considered spam is ultimately a decision for the moderation team, but it’s a topic that I think is worth discussing as the community continues to evolve.

Mastering the Rockets by National Reserves

The aerospace and rocket sector serves as a premier endgame industry in *Sim Companies*, offering massive payouts for well-capitalized players. It remains one of the most prestigious paths for ambitious entrepreneurs in the game. Unlike standard commodities, rockets operate through distinct mechanics: players either fulfill corporate contracts via **Sales Offices** to sell products like Sub-Orbital Rockets and BFRs, or construct a **Launch Pad** to send rockets into space themselves.

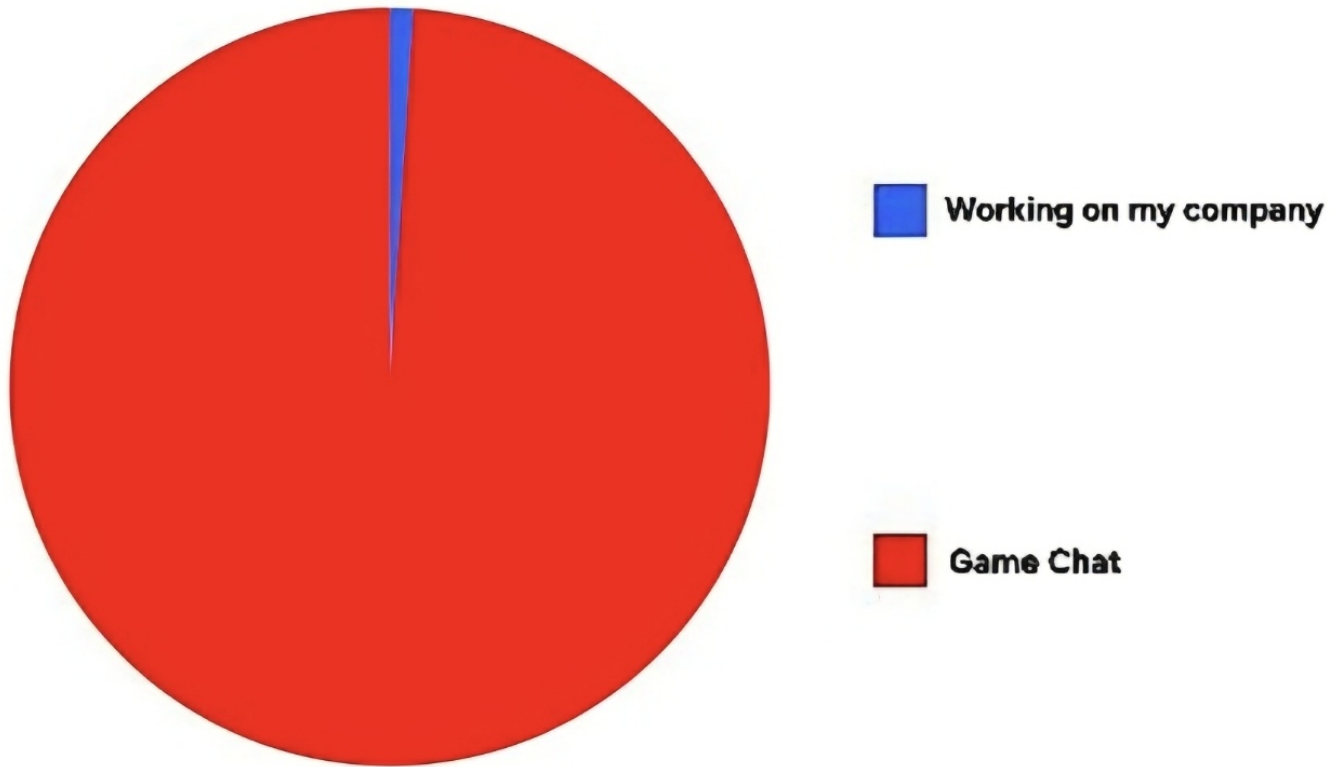

Building a rocket supply chain demands deep vertical integration due to the complex web of required components. Every rocket requires a precise combination of solid fuel, propellant tanks, heat shields, flight computers, and advanced engines before final assembly in a Vertical Integration Facility. Because administrative overhead compounds across these multi-tier supply chains, employing high-skill executives—particularly a capable Chief Technical Officer—is essential for preserving profit margins.

For players using Launch Pads, managing launch risks is a central operational focus. Launching rockets generates valuable Aerospace Research needed to boost product quality (\$Q\$), but carries an inherent risk of catastrophic failure on the pad. Low-quality (\$Q0\$) rockets suffer from high explosion rates that destroy capital without returning research, whereas upgrading to higher quality tiers drastically drops failure rates and maximizes returns.

Ultimately, mastering the aerospace sector requires balancing patience, capital management, and risk mitigation. While barriers to entry are steep, the rocket industry remains the gold standard for late-game success. For CEOs willing to optimize their supply chains, reaching for the stars offers some of the highest prestige and profitability *Sim Companies* has to offer
